

**(a) Interaction  $I = E_L - E_J$  under each ablation**

circles: the per-category values behind each mean

**(b) Absolute localisation the same ablations move**

Exploratory: the E2 table holds seed 0 and  $K = 1$  only, one run per ablation, so no interval exists and none is drawn. ABL-S removes the Gaussian smoothing, ABL-C replaces score fusion with naive concatenation ( $\alpha = w$  for equal slots, so only BAL can move), ABL-N removes per-branch normalisation and scores with squared Euclidean distance.
